## Overview

This document outlines some useful R code for plotting, cool functions, and other random tidbits.

#### Install dependencies

```
packages <- c("rgdal","dplyr","zoo","RColorBrewer","viridis","plyr","digitize","jpeg","devtools","image.
if (require(packages)) {
    install.packages(packages,dependencies = T)
    require(packages)
}
lapply(packages,library,character.only=T)</pre>
```

#### Attributes

Access structural attributes of unique classes, such as raster and ggmap.

```
# Normal example
df <- data.frame("X"=c(1:5),"Y"=c(6:10))
str(df)
df$X

# `attr` method
require(ggmap)
map <- get_map("Atlanta",zoom=12,source="stamen",maptype="toner-lines")
str(map)
attr(map,"bb")$ll.lat</pre>
```

#### Classes

Convert character to factor to numeric without conversion error

```
read.table(f,header=T,sep=",",row.names=NULL,stringsAsFactors=FALSE, strip.white=TRUE)
f$V2<-as.numeric(f$V2)</pre>
```

See call options for class

```
methods(class="estUDm")
```

Set dynamic input for variable / assign variable to char vector

```
shadedens<-function(shadedens){ # set shade density to clumped (to match food) or sparse
  if (shadedens == "Random"){
    NLCommand("set Shade-density \"Random\" ")
    }else{
    NLCommand("set Shade-density \"Clumped\" ")
    }
  }
  shadedens("Clumped") # set clumped resources</pre>
```

# Dataframes

Optimal empty data frame

```
df <- data.frame("a"=rnorm(10),"b"=(1:20))
df %>%
  mutate(
  "c"=rnorm(20),
  b = b *67
)
```

### ggplot functions

Remove annoying stock gridlines from plot window

Setting global graphics theme for ggplot

```
plot_it_gg <- function(bg,family){ # bq = colour to plot bq, family = font family
  theme_tufte(base_family = family) +
  theme(panel.border = element_blank(),
       panel.grid.major = element_blank(),
       panel.grid.minor = element_blank(),
       panel.background = element_rect(fill = bg,
                                        colour = bg),
        plot.background = element rect(fill=bg)
  ) +
    theme(axis.line = element_line(color = "white")) +
    theme(axis.ticks = element_line(color = "white")) +
    theme(plot.title = element_text(colour = "white")) +
   theme(axis.title.x = element_text(colour = "white"),
          axis.title.y = element_text(colour = "white")) +
    theme(axis.text.x = element_text(color = "white"),
          axis.text.y = element_text(color = "white")) +
    theme(legend.key = element_rect(fill = bg)) + # fill bg of legend
    theme(legend.title = element_text(colour="white")) + # legend title
    theme(legend.text = element_text(colour="white")) # legend labels
}
```

Put plot in function to take dynamic data inputs

Ref: http://jcborras.net/carpet/visualizing-political-divergences-2012-local-elections-in-helsinki.html

Using ggplot when looping through for loop and saving to dir

```
pdf("mypdf.pdf",onefile = T)
for(i in 1:3){
par(bty="n", las = 1)
  grid.arrange(
  ggplot(data, aes(x = X, y = Y, fill=..x..)) + # qeom_density_ridges()
    # scale = overlap
   geom_density_ridges_gradient(scale = 5, size=0.2,color="black", rel_min_height = 0.01,panel_scaling
    geom_density_ridges(scale = 5, size=0.2,color="black", rel_min_height = 0.01,fill="white",alpha=0.2
    # geom_density_ridges(scale = 5, size=0.2,color="white", rel_min_height = 0.01,fill=col,alpha=0.5)
    scale_fill_viridis(name = "Diameter", alpha=0.1, option = "magma", direction=-1) + # "magma", "infer
   xlim(c(0,25)) +
   labs(title = paste0("Title_",i)) +
   xlab("X") +
   ylab("Y") +
    # plot_it_gg("white")
} # end loop
dev.off()
```

#### NAs

Replace NAs with 0's

```
df[is.na(df)] <- 0
```

Replace X values less than given value (V) with 0

```
df$X[df$X<V] <- 0
```

Check for NAs

```
sapply(df, function(x) sum(is.na(x)))
```

Replace NaN and Inf values with NA

```
df$col1[which(!is.finite(df$col1))] <- NA</pre>
```

Fill in missing data values in sequence with NA

```
# /Users/malishev/Documents/Manuscripts/Chapter4/Sims/Chapter4_figs.R
library(zoo)
data <- data.frame(index = c(1:4, 6:10),
    data = c(1.5,4.3,5.6,6.7,7.1,12.5,14.5,16.8,3.4))
#you can create a series</pre>
```

```
z <- zoo(data$data, data$index)
#end extend it to the grid 1:10
z <- merge(zoo(,1:10), z)

#worked example
# fill in missing Tb values
minTb.d <- zoo(minTb$Tick,minTb$Days)
minTb.d <- merge(zoo(NULL,1:days), minTb.d) # make the minTb series match the temp series (117 days)
minTb.d <- as.numeric(minTb.d) # = time individuals reached VTMIN in ticks
minTb <- minTb.d - temp$Tick # get diff between starting time and time to reach VTMIN
minTb <- minTb/2 # convert ticks to minutes
minTb <- minTb/60 #convert to hours
minTb <- data.frame("Days"=1:days,"Time"=minTb)

# then fill in missing values
approx(minTb$Time,method = "linear")</pre>
```

#### **Plotting**

Plot one plot window above and two below

```
layout(matrix(c(1,1,2,3), 2, 2, byrow = TRUE))
```

Bookend axis ticks for plot E.g. at 0 and 100 when data is 1:99

```
axis(1,at=c(0,length(loco$X)),labels=c("",""))# bookending axis tick marks
```

Optimal legend formatting for base

```
legend("right",legend=c("Small","Intermediate","Large"),col=c(colfunc[colvec[1:3]]),
    bty="n",pch=20,pt.cex=1.5,cex=0.7,y.intersp = 0.5, xjust = 0.5,
    title="Size class",title.adj = 0.3,text.font=2,
    trace=T,inset=0.1)
```

Plot inset plot in current plot (https://stackoverflow.com/questions/17041246/how-to-add-an-inset-subplot-to-topright-of-an-r-plot)

Interactive plots with rCharts (javascript and d3 viz) http://ramnathv.github.io/rCharts/

```
require(devtools)
install_github('rCharts', 'ramnathv')
```

Cluster plot

https://rpubs.com/dgrtwo/technology-clusters

```
library(readr)
library(dplyr)
library(igraph)
library(ggraph)
library(ggforce)
# This shared file contains the number of question that have each pair of tags
# This counts only questions that are not deleted and have a positive score
tag_pair_data <- read_csv("http://varianceexplained.org/files/tag_pairs.csv.gz")</pre>
relationships <- tag_pair_data %>%
  mutate(Fraction = Cooccur / Tag1Total) %>%
  filter(Fraction >= .35) %>%
  distinct(Tag1)
v <- tag_pair_data %>%
  select(Tag1, Tag1Total) %>%
  distinct(Tag1) %>%
  filter(Tag1 %in% relationships$Tag1 |
         Tag1 %in% relationships$Tag2) %>%
  arrange(desc(Tag1Total))
a <- grid::arrow(length = grid::unit(.08, "inches"), ends = "first", type = "closed")
set.seed(2016)
relationships %>%
  graph_from_data_frame(vertices = v) %>%
  ggraph(layout = "fr") +
  geom_edge_link(aes(alpha = Fraction), arrow = a) +
  geom_node_point(aes(size = Tag1Total), color = "lightblue") +
  geom_node_text(aes(size = Tag1Total, label = name), check_overlap = TRUE) +
  scale_size_continuous(range = c(2, 9)) +
  ggforce::theme_no_axes() +
  theme(legend.position = "none")
```

Define global plotting graphics function

```
require(ggplot2)
require(ggthemes)
### set plotting params
plot_it <- function(manuscript,bg,cp1,cp2,alpha,family){ # plotting function (plot for MS or not, set b
    graphics.off()
    if(manuscript==0){
        if(bg=="black"){
            colvec <<- magma(200,1) # plot window bg # USES <<- OPERATOR
            par(bg = colvec[1],col.axis="white",col.lab="white",col.main="white",fg="white",bty="n",las=1,mar-
            border=adjustcolor("purple",alpha=0.5)
    }else{</pre>
```

```
colvec <<- bpy.colors(200) # plot window bg # USES <<- OPERATOR</pre>
      par(bg = colvec[1],col.axis="white",col.lab="white",col.main="white",fg="white",bty="n",las=1,mar
      border=adjustcolor("blue",alpha=0.5)
    }
  }else{
         graphics.off()
    par(bty="n",las=1,family=family)
    colv<-"white"
  }
  # color palettes
  # ifelse(manuscript==1,colvec<-adjustcolor(brewer.pal(9,cp1)[9], alpha = alpha),colvec <- adjustcolor
  # colfunc <<- colorRampPalette(brewer.pal(9,cp1),alpha=alpha)</pre>
  cp1 info <- brewer.pal.info[cp1,]$maxcolors</pre>
  cp2_info <- brewer.pal.info[cp2,]$maxcolors</pre>
  colv <<- brewer.pal(cp1_info,cp1) # USES <<- OPERATOR</pre>
  colv2 <<- brewer.pal(cp2_info,cp2) # USES <<- OPERATOR</pre>
}
# Setting agplot theme graphics
plot_it_gg <- function(bg){ # bq = colour to plot bq, family = font family</pre>
  if(bg=="white"){
    bg <- "white"
    fg <- "black"
    theme_tufte(base_family = "HersheySans") +
      theme(panel.border = element_blank(),panel.grid.major = element_blank(),panel.grid.minor = elemen
      theme(axis.line = element_line(color = fg)) +theme(axis.ticks = element_line(color = fg)) + theme
  }
}# end gg
# Set global plotting parameters
require(RColorBrewer)
display.brewer.all()
cat("plot_it( \n0 for presentation, 1 for manuscript, \nset colour for background, \nset colour palette
plot_it(0,"blue","Spectral","Greens",1,"mono") # set col function params
plot_it_gg("white") # same as above
Make plot cycle on one page
plot(m_abundance$gam,pages=1)
```

### Reading in files/data

Read in file manually

```
get.file.vol <- read.table(file.choose())#read file manually
v.file <- get.file.vol[1:100,1]#get the volume</pre>
```

Loop through files from dir and append to list

```
# reading in spdf (hrpath) files from drive
setwd("/Users/camel/Desktop/Matt2016/Manuscripts/MalishevBullKearney/Resubmission/2016/barcoo sims/barc
file.list<-list.files()
hrs75<-as.list(rep(1,100)) # empty list
for (f in 1:100){</pre>
```

```
load(file.list[f])
  hrs75[f]<-hrpath
}
# working version
#converting spdf into mcp(spdf,100,unout="m2)
ghr<-list()</pre>
for (i in hrs75[1:10]) {
  m<-mcp(i,100,unout='m2')</pre>
  ghr<-c(ghr,m)
};ghr
Regular expressions (regex)
Get just numbers or characters
vec <- "16-Feb-2018 20:08:04 PM"
vecN <- gsub("[^[:digit:]]", "", vec); vec; print(paste0("Just numbers: ",vecN))</pre>
[1] "16-Feb-2018 20:08:04 PM"
[1] "Just numbers: 162018200804"
vecC <- gsub("[[:digit:]]", "", vec); vec; print(paste0("Just characters: ", vecC))</pre>
[1] "16-Feb-2018 20:08:04 PM"
[1] "Just characters: -Feb- :: PM"
# with tidyr. requires data frame
require(tidyr)
df <- data.frame(N1=c("APPLE348744", "BANANA77845", "OATS2647892", "EGG98586456"))</pre>
print("tidyr doesn't work with strings separated by spaces")
[1] "tidyr doesn't work with strings separated by spaces"
df %>%
  separate(N1, into = c("text", "num"), sep = "(?<=[A-Za-z])(?=[0-9])")
# A tibble: 4 x 2
  text num
  <chr> <chr>
1 APPLE 348744
2 BANANA 77845
3 OATS
         2647892
4 EGG
         98586456
Insert or replace a character in a string at a specific location
require(stringi)
vec <- "ABCEF"
stri_sub(vec, 4, 2) <- "d"
print(paste0("Original: ABCEF")); print(paste0("New: ",vec))
[1] "Original: ABCEF"
```

[1] "New: ABCdEF"

#### R Markdown

Hide unwanted code output, such as inherent examples for functions

```
# ```{r, cache = TRUE, tidy = TRUE, lazy = TRUE, results='markup'}
```

### Subsetting

Select specific rows E.g. select rows of sfeed\_move not in foodh

```
library(sqldf)
a1NotIna2_h <- sqldf('SELECT * FROM sfeed_move EXCEPT SELECT * FROM foodh')
a1NotIna2_l <- sqldf('SELECT * FROM sfeed_move EXCEPT SELECT * FROM foodl')
# select rows from sfeed_move that also appear in foodh
a1Ina2_h <- sqldf('SELECT * FROM sfeed_move INTERSECT SELECT * FROM foodh')
a1Ina2_l <- sqldf('SELECT * FROM sfeed_move INTERSECT SELECT * FROM foodl')</pre>
```

Count occurrences of values in data frame

```
table(unlist(df\subseteq X))
```

Remove a specific column from a data frame

```
within(df, rm("Col1"))
```

#### Web scraping

Scraping web tables

 $http://web.mit.edu/\sim r/current/arch/i386\_linux26/lib/R/library/XML/html/readHTMLTable.html\% 5Bhttp://web.mit.edu/\sim r/current/arch/i386\_linux26/lib/R/library/XML/html/readHTMLTable.html\% 5D$ 

```
library(XML)
readHTMLTable()
```

Scraping Twitter timelines

See complete example at http://varianceexplained.org/r/trump-tweets/

```
# https://cran.r-project.org/web/packages/twitteR/
library(dplyr)
library(purrr)
library(twitteR)
```
